Team A1 Summary (Weeks 1 to 4)

A1 handled the general theory and the numerical side of the flexible-load project.

- Built the model and found the best setup, plus what it does to cost and emissions.
- Figured out when a flexible load lowers carbon and when it doesn't.
- Wrote code to check the theory against the math.
- Ran the comparative statics and one robustness case.
- Carried the results into the other operating regimes.
- Pulled it into one document and reviewed it.
